

INTERACTIVE GRAPHICS IN DATA PROCESSING

Application areas

Although treating individual applications, the papers in this section intend to demonstrate—by example—the potential of interactive computer graphics for various disciplines. The papers are grouped in order of decreasing generality. It should be understood that these graphics applications were implemented on an experimental basis. Since their implementation occurred at the same time as, or preceded, the development of the concepts and support discussed in the previous sections, they do not take advantage of these developments. Industry applications and the present status of interactive graphic displays in general are discussed separately in the final paper of this issue.
